

This set of notes aims to provide complete proofs of a number of asymptotic results regarding the Bootstrap [4] contained in Bickel and Freedman [1].

1 Bootstrap asymptotics for the I.I.D. sample mean

Theorem 1.1 (Bootstrap Central Limit Theorem for I.I.D. sample mean, Theorem 2.1 [1])

Let $(\Omega, \mathcal{A}, \nu)$ be a probability space. Let $X, X_1, X_2, \dots : \Omega \rightarrow \mathbb{R}$ be a sequence of independent and identically distributed \mathbb{R} -valued random variables defined on Ω *with finite expectation value $\mu_X \in \mathbb{R}$ and variance $\sigma_X^2 < \infty$* . For each $n \in \mathbb{N}$, define:

$$\bar{X}_n : \Omega \rightarrow \mathbb{R} : \omega \mapsto \frac{1}{n} \sum_{i=1}^n X_i(\omega).$$

For $n, m \in \mathbb{N}$, define $\mathcal{S}_m^{(n)}$ to be the set of all functions from $\{1, 2, \dots, m\} \rightarrow \{1, 2, \dots, n\}$. Thus, each

$$s = (s(1), s(2), \dots, s(m)) \in \mathcal{S}_m^{(n)}$$

can be regarded as a length- m finite (ordered) sequence of positive integers between 1 and n , inclusive. Note that $\mathcal{S}_m^{(n)}$ is a finite set with $|\mathcal{S}_m^{(n)}| = n^m$. Endow $\mathcal{S}_m^{(n)}$ with the probability space structure induced by the uniform probability function:

$$P_{\mathcal{S}_m^{(n)}}(s) := \frac{1}{n^m}, \quad \text{for each } s \in \mathcal{S}_m^{(n)}.$$

Let $\Omega \times \mathcal{S}_m^{(n)}$ be the product probability space of Ω and $\mathcal{S}_m^{(n)}$. Define:

$$\bar{X}_m^{(n)} : \Omega \times \mathcal{S}_m^{(n)} \rightarrow \mathbb{R} : (\omega, s) \mapsto \frac{1}{m} \sum_{j=1}^m X_{s(j)}(\omega).$$

For each $\omega \in \Omega$, define:

$$Y_{m,\omega}^{(n)} : \mathcal{S}_m^{(n)} \rightarrow \mathbb{R} : s \mapsto \sqrt{m} \left(\bar{X}_m^{(n)}(\omega, s) - \bar{X}_n(\omega) \right)$$

Then,

$$P \left(Y_{m,\omega}^{(n)} \xrightarrow{d} N(0, \sigma_X^2), \text{ as } n, m \rightarrow \infty \right) = \nu \left(\left\{ \omega \in \Omega \mid Y_{m,\omega}^{(n)} \xrightarrow{d} N(0, \sigma_X^2), \text{ as } n, m \rightarrow \infty \right\} \right) = 1.$$

Remark 1.2

For each fixed $\omega \in \Omega$, $\left\{ Y_{m,\omega}^{(n)} : \mathcal{S}_m^{(n)} \rightarrow \mathbb{R} \right\}_{n,m \in \mathbb{N}}$ is a doubly indexed sequence of \mathbb{R} -valued random variables. Note that their respective domains $\mathcal{S}_m^{(n)}$ are pairwise distinct probability spaces. The **Bootstrap Central Limit Theorem for I.I.D. sample mean** asserts that for almost every $\omega \in \Omega$, the doubly indexed sequence $\left\{ Y_{m,\omega}^{(n)} \right\}$ of \mathbb{R} -valued random variables converges in distribution to $N(0, \sigma_X^2)$ as $n, m \rightarrow \infty$.

Remark 1.3 The following results are well known from classical asymptotic theory:

By the **Weak Law of Large Numbers**, \bar{X}_n converges in probability to μ_X , as $n \rightarrow \infty$; in other words,

$$\lim_{n \rightarrow \infty} P \left(|\bar{X}_n - \mu_X| > \varepsilon \right) = \lim_{n \rightarrow \infty} \nu \left(\left\{ \omega \in \Omega : |\bar{X}_n(\omega) - \mu_X| > \varepsilon \right\} \right) = 0, \quad \text{for each } \varepsilon > 0.$$

By the **Strong Law of Large Numbers**, \bar{X}_n converges almost surely to μ_X , as $n \rightarrow \infty$; in other words,

$$P \left(\lim_{n \rightarrow \infty} \bar{X}_n = \mu_X \right) = \nu \left(\left\{ \omega \in \Omega \mid \lim_{n \rightarrow \infty} \bar{X}_n(\omega) = \mu_X \right\} \right) = 1.$$

By the **Central Limit Theorem**, $\sqrt{n}(\bar{X}_n - \mu_X)$ converges in distribution to $N(0, \sigma_X^2)$.

PROOF Let $\mathcal{M}_1(\mathbb{R}, \mathcal{B}(\mathbb{R}))$ denotes the set of probability measures on $(\mathbb{R}, \mathcal{B}(\mathbb{R}))$. Let

$$\mathcal{W}_1^2(\mathbb{R}, \mathcal{B}(\mathbb{R})) := \left\{ G \in \mathcal{M}_1(\mathbb{R}, \mathcal{B}(\mathbb{R})) \mid \int_{\mathbb{R}} x^2 dG(x) < \infty \right\}.$$

denote the Wasserstein space (Definition A.2) of order 2 of the measurable space $(\mathbb{R}, \mathcal{B}(\mathbb{R}))$, whose underlying topological space (1-dimensional Euclidean space) is a Polish space (i.e. separable complete metric space). Let

$$W_2 : \mathcal{W}_1^2(\mathbb{R}, \mathcal{B}(\mathbb{R})) \times \mathcal{W}_1^2(\mathbb{R}, \mathcal{B}(\mathbb{R})) \longrightarrow \mathbb{R} : (G, G') \longmapsto \inf \left\{ \sqrt{E(|X - Y|^2)} \mid (X, Y) \in \Pi(G, G') \right\}$$

denote the Wasserstein metric (Theorem A.3) on $\mathcal{W}_1^2(\mathbb{R}, \mathcal{B}(\mathbb{R}))$.

For each $m \in \mathbb{N}$, let $F^{(m)} \in \mathcal{M}_1(\mathbb{R}, \mathcal{B}(\mathbb{R}))$ denote the distribution of

$$Y^{(m)} : \Omega \longrightarrow \mathbb{R} : \omega \longmapsto \sqrt{m} (\bar{X}_m(\omega) - \mu_X).$$

And, for each $\omega \in \Omega$, and each $m, n \in \mathbb{N}$, let $F_n^{(m)}(\omega) \in \mathcal{M}_1(\mathbb{R}, \mathcal{B}(\mathbb{R}))$ denote the distribution of

$$Y_{m,\omega}^{(n)} : \mathcal{S}_m^{(n)} \longrightarrow \mathbb{R} : s \longmapsto \sqrt{m} (\bar{X}_m^{(n)}(\omega, s) - \bar{X}_n(\omega)).$$

Note that $N(0, \sigma_X^2) \in \mathcal{W}_1^2(\mathbb{R}, \mathcal{B}(\mathbb{R}))$. By hypothesis, $F^{(m)} \in \mathcal{W}_1^2(\mathbb{R}, \mathcal{B}(\mathbb{R}))$ for each $m \in \mathbb{N}$. And, for each $\omega \in \Omega$, $m, n \in \mathbb{N}$, we have $F_n^{(m)}(\omega) \in \mathcal{W}_1^2(\mathbb{R}, \mathcal{B}(\mathbb{R}))$, since $\mathcal{S}_m^{(n)}$ is a finite probability space. Therefore, by Theorem A.3 and Claim 3 below, the following inequalities hold: For each $\omega \in \Omega$ and $m, n \in \mathbb{N}$,

$$\begin{aligned} W_2(F_n^{(m)}(\omega), N(0, \sigma_X^2)) &\leq W_2(F_n^{(m)}(\omega), F^{(m)}) + W_2(F^{(m)}, N(0, \sigma_X^2)) \\ &\leq W_2(F_n(\omega), F) + W_2(F^{(m)}, N(0, \sigma_X^2)). \end{aligned}$$

Thus, the present Theorem follows by Theorem A.6 and the following two claims:

Claim 1: $W_2(F^{(m)}, N(0, \sigma_X^2)) \longrightarrow 0$, as $m \longrightarrow \infty$.

Claim 2: $\nu\left(\left\{ \omega \in \Omega \mid W_2(F_n(\omega), F) \longrightarrow 0, \text{ as } n \longrightarrow \infty \right\}\right) = 1$.

Proof of Claim 1: By the Classical Central Limit Theorem, $F^{(m)} \xrightarrow{w} N(0, \sigma_X^2)$. Since $E[Y^{(m)}] = 0$, we have

$$\begin{aligned} \int_{\mathbb{R}} y^2 dF^{(m)}(y) &= E\left[\left(Y^{(m)}\right)^2\right] = \text{Var}[Y^{(m)}] = m \cdot \text{Var}\left[\left(\frac{1}{m} \sum_{i=1}^m X_i\right) - \mu_X\right] \\ &= \frac{m}{m^2} \cdot \sum_{i=1}^m \text{Var}[X_i] = \frac{1}{m} \cdot m \cdot \sigma_X^2 = \sigma_X^2, \end{aligned}$$

which is the second moment of $N(0, \sigma_X^2)$. Hence, by Definition A.5, we have $F^{(m)} \xrightarrow{\mathcal{W}_1^2} N(0, \sigma_X^2)$, and by Theorem A.6, we have $W_2(F^{(m)}, N(0, \sigma_X^2)) \longrightarrow 0$, as $m \longrightarrow \infty$. This completes the proof of Claim 1.

Proof of Claim 2: By hypothesis $\mu_X := E[X] \in \mathbb{R}$ and $\sigma_X^2 := \text{Var}[X] < \infty$. Hence $E[X^2] = \text{Var}[X] + E[X]^2 < \infty$. Thus, by the Strong Law of Large Numbers, we have:

$$\int_{\mathbb{R}} x^2 dF_n(\omega)(x) = \frac{1}{n} \sum_{i=1}^n X_i(\omega)^2 \xrightarrow{\text{a.e.}} E[X^2] = \int_{\mathbb{R}} x^2 dF(x),$$

equivalently,

$$\nu\left(\left\{\omega \in \Omega \mid \int_{\mathbb{R}} x^2 dF_n(\omega)(x) \longrightarrow \int_{\mathbb{R}} x^2 dF(x) \right\}\right) = 1.$$

On the other hand, by the Glivenko-Cantelli Theorem, we have:

$$\nu\left(\left\{\omega \in \Omega \mid \lim_{n \rightarrow \infty} \sup_{t \in \mathbb{R}} |F_n(\omega)(t) - F(t)| = 0 \right\}\right) = 1,$$

which implies trivially

$$\nu\left(\left\{\omega \in \Omega \mid \lim_{n \rightarrow \infty} F_n(\omega)(t) = F(t), \text{ for each } t \in \mathbb{R} \right\}\right) = 1,$$

which in turn implies

$$\nu\left(\left\{\omega \in \Omega \mid F_n(\omega) \xrightarrow{w} F \right\}\right) = 1.$$

Note that in the above assertion, we used the slight abuse of notation that $F_n(\omega)$ represents both the distribution (measure) $F_n(\omega) \in \mathcal{M}_1(\mathbb{R}, \mathcal{B}(\mathbb{R}))$ as well as its cumulative distribution function defined on \mathbb{R} . Thus, we see that Theorem A.6, the Glivenko-Cantelli Theorem, and the Strong Law of Large Numbers together imply:

$$\begin{aligned} & \nu\left(\left\{\omega \in \Omega \mid W_2(F_n(\omega), F) \longrightarrow 0 \right\}\right) \\ &= \nu\left(\left\{\omega \in \Omega \mid F_n(\omega) \xrightarrow{\mathcal{W}_2^2} F \right\}\right) \\ &= \nu\left(\left\{\omega \in \Omega \mid F_n(\omega) \xrightarrow{w} F \text{ and } \int_{\mathbb{R}} x^2 dF_n(\omega)(x) \longrightarrow \int_{\mathbb{R}} x^2 dF(x) \right\}\right) \\ &= \nu\left(\left\{\omega \in \Omega \mid F_n(\omega) \xrightarrow{w} F \right\} \cap \left\{\omega \in \Omega \mid \int_{\mathbb{R}} x^2 dF_n(\omega)(x) \longrightarrow \int_{\mathbb{R}} x^2 dF(x) \right\}\right) \\ &= 1. \end{aligned}$$

This completes the proof of Claim 2.

Claim 3: Let $G \in \mathcal{W}_1^2(\mathbb{R}, \mathcal{B}(\mathbb{R}))$ and $m \in \mathbb{N}$. Suppose $Z_1^{(G)}, Z_2^{(G)}, \dots, Z_m^{(G)}$ are independent and identically distributed random variables, each having distribution G . Let $G^{(m)} \in \mathcal{M}_1(\mathbb{R}, \mathcal{B}(\mathbb{R}))$ be the (empirical) measure of the random variable

$$Y_m^{(G)} := \frac{1}{m^{1/2}} \sum_{i=1}^m (Z_i^{(G)} - \mu_G) : \Omega \longrightarrow \mathbb{R},$$

where $\mu_G := \int_{\mathbb{R}} x dG(x)$ is the expectation value of the distribution G . Then, for any $G, H \in \mathcal{W}_1^2(\mathbb{R}, \mathcal{B}(\mathbb{R}))$, we have

$$W_2(G^{(m)}, H^{(m)}) \leq W_2(G, H).$$

Proof of Claim 3:

□

A Wasserstein Spaces

Proofs of results mentioned in this section can be found in Chapters 1 and 6 of [6].

Suppose (S, \mathcal{S}) and (T, \mathcal{T}) are two measurable spaces. We will use the following notations:

- $(S \times T, \mathcal{S} \otimes \mathcal{T})$ denotes their product measurable space (see Chapter 10, [5]).
- $\mathcal{M}_1(S, \mathcal{S})$, $\mathcal{M}_1(T, \mathcal{T})$, and $\mathcal{M}_1(S \times T, \mathcal{S} \otimes \mathcal{T})$ denote the sets of probability measures on the respective measurable spaces.
- $\Pi^S : S \times T \longrightarrow S : (s, t) \longmapsto s$ and $\Pi^T : S \times T \longrightarrow T : (s, t) \longmapsto t$ are the canonical projection maps, and

$$\Pi_*^S : \mathcal{M}_1(S \times T, \mathcal{S} \otimes \mathcal{T}) \longrightarrow \mathcal{M}_1(S, \mathcal{S}) : \pi \longmapsto \left(A \in \mathcal{S} \longmapsto \pi[(\Pi^S)^{-1}(A)] \right),$$

$$\Pi_*^T : \mathcal{M}_1(S \times T, \mathcal{S} \otimes \mathcal{T}) \longrightarrow \mathcal{M}_1(T, \mathcal{T}) : \pi \longmapsto \left(B \in \mathcal{T} \longmapsto \pi[(\Pi^T)^{-1}(B)] \right)$$

are the corresponding push-forward maps of measures.

Definition A.1 (Coupling measures and couplings (Definition 1.1, [6]))

Let (S, \mathcal{S}) and (T, \mathcal{T}) be two measurable spaces. Let $\mu \in \mathcal{M}_1(S, \mathcal{S})$ and $\nu \in \mathcal{M}_1(T, \mathcal{T})$.

- A **coupling (probability) measure** of μ and ν is a probability measure $\pi \in \mathcal{M}_1(S \times T, \mathcal{S} \otimes \mathcal{T})$ whose push-forwards under the canonical projection maps are μ and ν respectively; in other words $\pi \in \mathcal{M}_1(S \times T, \mathcal{S} \otimes \mathcal{T})$ is a coupling measure of $(\mu, \nu) \in \mathcal{M}_1(S, \mathcal{S}) \times \mathcal{M}_1(T, \mathcal{T})$ if π satisfies:

$$\Pi_*^S(\pi) = \mu \quad \text{and} \quad \Pi_*^T(\pi) = \nu.$$

In this case, μ and ν are called the **marginal (probability) measures** of π . We denote by $\Pi(\mu, \nu)$ the subset of $\mathcal{M}_1(S \times T, \mathcal{S} \otimes \mathcal{T})$ of all coupling probability measures of μ and ν .

- A **coupling** of μ and ν is an $(S \times T)$ -valued random variable

$$Z = (X, Y) : (\Omega, \mathcal{A}, P_\Omega) \longrightarrow (S \times T, \mathcal{S} \otimes \mathcal{T})$$

whose induced measure on $(S \times T, \mathcal{S} \otimes \mathcal{T})$ is a coupling probability measure of μ and ν . More precisely,

$$\mu(A) = P_X(A) = P_\Omega(X^{-1}(A)) = P_\Omega((\Pi^S \circ Z)^{-1}(A)) = P_\Omega(Z^{-1}[(\Pi^S)^{-1}(A)]), \quad \text{for each } A \in \mathcal{S}$$

$$\nu(B) = P_Y(B) = P_\Omega(Y^{-1}(B)) = P_\Omega((\Pi^T \circ Z)^{-1}(B)) = P_\Omega(Z^{-1}[(\Pi^T)^{-1}(B)]), \quad \text{for each } B \in \mathcal{T}$$

Definition A.2 (Wasserstein distances and Wasserstein spaces (Definitions 6.1 and 6.4, [6]))

Let $p \in [1, \infty)$. Let (S, ρ) be a Polish space (i.e. separable complete metric space), and \mathcal{S} its Borel σ -algebra.

- The **Wasserstein distance of order p** is, by definition, the map $W_p : \mathcal{M}_1(S, \mathcal{S}) \times \mathcal{M}_1(S, \mathcal{S}) \longrightarrow \mathbb{R} \cup \{+\infty\}$ given by:

$$\begin{aligned} W_p(\mu, \nu) &:= \inf_{\pi \in \Pi(\mu, \nu)} \left\{ \left(\int_{S \times S} \rho(x, y)^p \, d\pi(x, y) \right)^{1/p} \right\} \\ &= \inf \left\{ (E[\rho(X, Y)^p])^{1/p} \in \mathbb{R} \cup \{+\infty\} \mid \begin{array}{l} X, Y : (\Omega, \mathcal{A}, \pi) \longrightarrow (S, \mathcal{S}) \text{ are } S\text{-valued} \\ \text{random variables with } X^*(\pi) = \mu, Y^*(\pi) = \nu \end{array} \right\}. \end{aligned}$$

- The **Wasserstein space of order p** is defined to be:

$$\mathcal{W}_1^p(S, \mathcal{S}) := \left\{ \mu \in \mathcal{M}_1(S, \mathcal{S}) \mid \int_S \rho(x_0, x)^p \, d\mu(x) < \infty \right\},$$

where $x_0 \in S$ is an arbitrary point in S ($\mathcal{W}_1^p(S, \mathcal{S})$ is independent of the choice of $x_0 \in S$). Thus, $\mathcal{W}_1^p(S, \mathcal{S})$ is the set of probability measures on (S, \mathcal{S}) with finite moment of order p .

Theorem A.3 (Wasserstein metrics (Definition 6.4 and Theorem 6.18, [6]))

- The Wasserstein space $\mathcal{W}_1^p(S, \mathcal{S})$ is independent of the choice of the point $x_0 \in S$ in its definition.
- The Wasserstein distance W_p restricts to a metric on $\mathcal{W}_1^p(S, \mathcal{S}) \times \mathcal{W}_1^p(S, \mathcal{S})$.
- For a Polish space (i.e. separable complete metric space) (S, ρ) with Borel σ -algebra \mathcal{S} , the Wasserstein space $\mathcal{W}_1^p(S, \mathcal{S})$, when metrized by the Wasserstein metric W_p , is itself a Polish space.

Definition A.4 (Weak convergence in metric spaces (Chapter 1, [3]))

Suppose:

- (S, ρ) is a metric space and \mathcal{S} is its Borel σ -algebra.
- $\mathcal{M}_1(S, \mathcal{S})$ denotes the set of probability measures defined on (S, \mathcal{S}) .
- $\mu \in \mathcal{M}_1(S, \mathcal{S})$ and $\{\mu_k\}_{k \in \mathbb{N}} \subset \mathcal{M}_1(S, \mathcal{S})$.

Then, $\{\mu_k\}_{k \in \mathbb{N}}$ is said to **converge weakly** to μ if, for each $f \in C_b(S, \mathbb{R})$,

$$\int_S f(x) d\mu_k(x) \longrightarrow \int_S f(x) d\mu(x), \text{ as } k \longrightarrow \infty,$$

where $C_b(S, \mathbb{R})$ denotes the set of all bounded continuous \mathbb{R} -valued functions on S . We write $\mu_k \xrightarrow{w} \mu$ for μ_k converging weakly to μ .

Definition A.5 (Weak convergence in Wasserstein spaces (Definition 6.8, [6]))

Suppose:

- (X, ρ) is a Polish space, and \mathcal{S} is its Borel σ -algebra.
- $p \in [1, \infty)$ and $\mathcal{W}_1^p(S, \mathcal{S})$ is the corresponding Wasserstein space of order p .
- $\mu \in \mathcal{W}_1^p(S, \mathcal{S})$ and $\{\mu_k\}_{k \in \mathbb{N}} \subset \mathcal{W}_1^p(S, \mathcal{S})$.

Then, $\{\mu_k\}_{k \in \mathbb{N}}$ is said to **converge weakly in $\mathcal{W}_1^p(S, \mathcal{S})$** to μ if, for some (hence any) $x_0 \in S$, we have:

$$\mu_k \xrightarrow{w} \mu \quad \text{and} \quad \int_S \rho(x_0, x)^p d\mu_k(x) \longrightarrow \int_S \rho(x_0, x)^p d\mu(x), \text{ as } k \longrightarrow \infty.$$

We write $\mu_k \xrightarrow{\mathcal{W}_1^p} \mu$ for μ_k converging weakly to μ in $\mathcal{W}_1^p(S, \mathcal{S})$.

Theorem A.6 (Wasserstein metrics metrize weak convergence in Wasserstein spaces (Theorem 6.9, [6]))

Suppose:

- (X, ρ) is a Polish space, and \mathcal{S} is its Borel σ -algebra.
- $p \in [1, \infty)$, $(\mathcal{W}_1^p(S, \mathcal{S}), W_p)$ is the corresponding Wasserstein space of order p , metrized by the Wasserstein metric W_p defined on it.
- $\mu \in \mathcal{W}_1^p(S, \mathcal{S})$ and $\{\mu_k\}_{k \in \mathbb{N}} \subset \mathcal{W}_1^p(S, \mathcal{S})$.

Then,

$$\mu_k \xrightarrow{\mathcal{W}_1^p} \mu \quad \text{if and only if} \quad W_p(\mu_k, \mu) \longrightarrow 0.$$

B A stochastic process $\{X_t : \Omega \longrightarrow V\}_{t \in T}$ and its equivalent V^T -valued random variable $X : \Omega \longrightarrow V^T$

Let Ω , T , and V be non-empty sets. Let $\{X_t : \Omega \longrightarrow V\}_{t \in T}$ be a T -index family of maps, each of which maps from Ω into V . Note that this family of maps is set-theoretically equivalent (in the sense that either one completely determines the other) to the following (V^T) -valued map defined on Ω :

$$X : \Omega \longrightarrow V^T : \omega \longmapsto (t \longmapsto X_t(\omega)),$$

where $V^T = \prod_{t \in T} V$ denotes the set of all (arbitrary) V -valued functions defined on T . In this section, we aim to establish the following two results:

- Suppose (Ω, \mathcal{A}) and (V, \mathcal{F}) are measurable space structures on Ω and V , respectively. Then, $X : \Omega \longrightarrow V^T$ is $(\mathcal{A}, \sigma[(V, \mathcal{F})^T])$ -measurable if and only if $X_t : \Omega \longrightarrow V$ is $(\mathcal{A}, \mathcal{F})$ -measurable for each $t \in T$. Here, $\sigma[(V, \mathcal{F})^T]$ denotes the product σ -algebra on V^T , which is by definition the smallest σ -algebra on V^T such that, for each $t \in T$, the projection map (or evaluation map)

$$\pi_t : V^T \longrightarrow V : x \longmapsto x(t)$$

is $(\sigma[(V, \mathcal{F})^T], \mathcal{F})$ -measurable.

- An immediate corollary of the above result is that: Suppose $(\Omega, \mathcal{A}, \mu)$ is a probability space structure on Ω , (V, \mathcal{F}) is a measurable space structure on V , and $\sigma[(V, \mathcal{F})^T]$ is the product σ -algebra on V^T . Then, $X : (\Omega, \mathcal{A}, \mu) \longrightarrow (V^T, \sigma[(V, \mathcal{F})^T])$ is V^T -valued random variable if and only if $\{X_t : (\Omega, \mathcal{A}, \mu) \longrightarrow (V, \mathcal{F})\}_{t \in T}$ is a stochastic process.

Definition B.1 (The product σ -algebra of a Cartesian product of measurable spaces)

Let T be an arbitrary non-empty set. For each $t \in T$, let (V_t, \mathcal{F}_t) be a measurable space (in particular, $V_t \neq \emptyset$). Let $\prod_{t \in T} V_t$ be the Cartesian product of $\{V_t\}_{t \in T}$. In other words,

$$\prod_{t \in T} V_t := \left\{ v : T \longrightarrow \bigsqcup_{t \in T} V_t \mid v(t) \in V_t, \text{ for each } t \in T \right\}.$$

That $\prod_{t \in T} V_t \neq \emptyset$ follows from the Axiom of Choice. For each $t \in T$, let

$$\pi_t : \prod_{\tau \in T} V_\tau \longrightarrow V_t : v \longmapsto v(t)$$

be the projection map from $\prod_{\tau \in T} V_\tau$ onto V_t . The **product σ -algebra** on $\prod_{t \in T} V_t$ is the following:

$$\sigma\left(\left\{ \pi_t^{-1}(F) \subset \prod_{\tau \in T} V_\tau \mid F \in \mathcal{F}_t, t \in T \right\}\right) \subset \text{PowerSet}\left(\prod_{t \in T} V_t\right).$$

Clearly, it is the smallest σ -algebra on $\prod_{t \in T} V_t$ with respect to which each projection map $\pi_t : \prod_{t \in T} V_t \longrightarrow (V_t, \mathcal{F}_t)$ is measurable. We denote the product σ -algebra on $\prod_{t \in T} V_t$ by

$$\sigma\left(\prod_{t \in T} (V_t, \mathcal{F}_t)\right).$$

Theorem B.2

Suppose Ω , T , and V are non-empty sets. Let $\{X_t : \Omega \longrightarrow V\}_{t \in T}$ be a T -indexed family of V -valued maps defined on Ω . Then, the following statements are true:

1. The family $\{X_t : \Omega \longrightarrow V\}_{t \in T}$ of maps is set-theoretically equivalent (in the sense that either completely determines the other) to the following (V^T) -valued map defined on Ω :

$$X : \Omega \longrightarrow V^T : \omega \longmapsto (t \longmapsto X_t(\omega)),$$

where $V^T = \prod_{t \in T} V$ denotes the set of all (arbitrary) V -valued functions defined on T .

2. Suppose:

- (Ω, \mathcal{A}) and (V, \mathcal{F}) are measurable space structures on Ω and V , respectively.
- $W \subset V^T$ is a subset of V^T such that $X(\Omega) = \bigcup_{t \in T} X_t(\Omega) \subset W$.
- (W, \mathcal{G}) is a measurable space structure on W such that, for each $t \in T$, the projection map

$$\pi_t : W \longrightarrow V : w \longmapsto w(t)$$

is $(\mathcal{G}, \mathcal{F})$ -measurable.

Then, $(\mathcal{A}, \mathcal{G})$ -measurability of $X : \Omega \longrightarrow W$ implies $(\mathcal{A}, \mathcal{F})$ -measurability of $X_t : \Omega \longrightarrow V$ for each $t \in T$.

3. Suppose:

- (Ω, \mathcal{A}) and (V, \mathcal{F}) are measurable space structures on Ω and V , respectively.
- $\sigma[(V, \mathcal{F})^T]$ is the product σ -algebra on $V^T = \prod_{t \in T} V$ generated by the collection of projection maps

$$\left\{ \pi_t : V^T = \prod_{\tau \in T} V \longrightarrow V : w \longmapsto w(t) \right\}_{t \in T}.$$

Then, $X : \Omega \longrightarrow V^T$ is $(\mathcal{A}, \sigma[(V, \mathcal{F})^T])$ -measurable if and only if $X_t : \Omega \longrightarrow V$ is $(\mathcal{A}, \mathcal{F})$ -measurable for each $t \in T$.

PROOF

1. The proof of this result is routine and we omit it.
2. Suppose $X : \Omega \longrightarrow W$ is $(\mathcal{A}, \mathcal{G})$ -measurable. Note that $X_t = \pi_t \circ X$, where

$$\pi_t : V^T = \prod_{t \in T} V \longrightarrow V : v \longmapsto v(t)$$

is the projection from $V^T = \prod_{\tau \in T} V$ onto the t -th factor. By hypothesis, $\pi_t : W \longrightarrow V$ is $(\mathcal{G}, \mathcal{F})$ -measurable for each $t \in T$. This implies, for each $t \in T$, $X_t = \pi_t \circ X$ is $(\mathcal{A}, \mathcal{F})$ -measurable, being a composition of two measurable maps.

3. Since, for each $t \in T$, the projection map $\pi_t : V^T \longrightarrow V$ is $(\sigma[(V, \mathcal{F})^T], \mathcal{F})$ -measurable (by construction of the σ -algebra $\sigma[(V, \mathcal{F})^T]$ on V^T), the preceding result immediately implies the following implication:

$$(\mathcal{A}, \sigma[(V, \mathcal{F})^T])\text{-measurability of } X : \Omega \longrightarrow V^T \implies (\mathcal{A}, \mathcal{F})\text{-measurability of } X_t : \Omega \longrightarrow V, \text{ for each } t \in T.$$

Conversely, suppose X_t is $(\mathcal{A}, \mathcal{F})$ -measurable for each $t \in T$. Recall that the product σ -algebra on V^T is generated by sets of the form:

$$\pi_t^{-1}(F), \text{ for some } t \in T \text{ and } F \in \mathcal{F}.$$

It follows that, for each $t \in T$ and each $F \in \mathcal{F}$, we have

$$X^{-1}(\pi_t^{-1}(F)) = (X^{-1} \circ \pi_t^{-1})(F) = (\pi_t \circ X)^{-1}(F) = X_t^{-1}(F) \subset \Omega$$

is \mathcal{A} -measurable, since $X_t : (\Omega, \mathcal{A}) \longrightarrow (V, \mathcal{F})$ is $(\mathcal{A}, \mathcal{F})$ -measurable by hypothesis. This proves that $X : \Omega \longrightarrow V^T$ is $(\mathcal{A}, \sigma[(V, \mathcal{F})^T])$ -measurable. \square

Definition B.3 (Stochastic processes)

A **stochastic process** is a family, indexed by some non-empty set T ,

$$\{ X_t : (\Omega, \mathcal{A}, \mu) \longrightarrow (V, \mathcal{F}) \}_{t \in T}$$

of $(\mathcal{A}, \mathcal{F})$ -measurable maps, where the common domain $(\Omega, \mathcal{A}, \mu)$ is a probability space and the common codomain (V, \mathcal{F}) is a measurable space. The common codomain (V, \mathcal{F}) is called the **state space** of the stochastic process.

Corollary B.4

Suppose:

- $(\Omega, \mathcal{A}, \mu)$ is a probability space and (V, \mathcal{F}) is a measurable space.
- T is a non-empty set and $W \subset V^T = \prod_{t \in T} V$.
- (W, \mathcal{G}) is a measurable space structure on W such that, for each $t \in T$, the projection map

$$\pi_t : W \longrightarrow V : w \longmapsto w(t)$$

is $(\mathcal{G}, \mathcal{F})$ -measurable.

If $X : (\Omega, \mathcal{A}, \mu) \longrightarrow (V^T, \sigma[(V, \mathcal{F})^T])$ is a V^T -valued random variable (i.e. X is $(\mathcal{A}, \sigma[(V, \mathcal{F})^T])$ -measurable), then its set-theoretically equivalent T -indexed family of V -valued maps defined on Ω

$$\left\{ \begin{array}{lll} X_t & : & (\Omega, \mathcal{A}, \mu) \longrightarrow (V, \mathcal{F}) \\ \omega & \longmapsto & (\pi_t \circ X)(\omega) = \pi_t(X(\omega)) = X(\omega)(t) \end{array} \right\}_{t \in T}$$

is a stochastic process (i.e. X_t is $(\mathcal{A}, \mathcal{F})$ -measurable for each $t \in T$).

Corollary B.5

Suppose:

- T, Ω, V are non-empty sets.
- $(\Omega, \mathcal{A}, \mu)$ is a probability space structure on Ω , (V, \mathcal{F}) is a measurable space structure on V .
- $\sigma[(V, \mathcal{F})^T]$ denotes the corresponding product σ -algebra on $V^T = \prod_{t \in T} V$.

Let $\{ X_t : \Omega \longrightarrow V \}_{t \in T}$ be a T -indexed family of V -valued maps defined on Ω , and let

$$X : \Omega \longrightarrow V^T : \omega \longmapsto (t \longmapsto X_t(\omega))$$

be its set-theoretically equivalent (V^T) -valued map defined on Ω . Then,

$$\{ X_t : (\Omega, \mathcal{A}, \mu) \longrightarrow (V, \mathcal{F}) \}_{t \in T}$$

is a stochastic process if and only if

$$X : (\Omega, \mathcal{A}, \mu) \longrightarrow (V^T, \sigma[(V, \mathcal{F})^T])$$

is a (V^T) -valued random variable.

C Uniqueness of the “full distribution” of a stochastic process $\{X_t : \Omega \longrightarrow V\}_{t \in T}$ given its finite-dimensional distributions

Definition C.1 (Finite-dimensional distributions of a stochastic process)

Let $\{X_t : (\Omega, \mathcal{A}, \mu) \longrightarrow (V, \mathcal{F})\}_{t \in T}$ be a stochastic process. Let $n \in \mathbb{N}$ and $t_1, t_2, \dots, t_n \in T$ be distinct elements of T . Let $\mathcal{P}_{(X_{t_1}, \dots, X_{t_n})} \in \mathcal{M}_1(V^n, \mathcal{F}^{\otimes n})$ denote the probability measure induced on the product measurable space $(V^n, \mathcal{F}^{\otimes n})$ by the random variable

$$(X_{t_1}, X_{t_2}, \dots, X_{t_n}) : (\Omega, \mathcal{A}, \mu) \longrightarrow (V^n, \mathcal{F}^{\otimes n})$$

$\mathcal{P}_{(X_{t_1}, \dots, X_{t_n})}$ is called a **finite-dimensional distribution** of the stochastic process.

Theorem C.2

Let (V, \mathcal{F}) be a measurable space, and $\sigma[(V, \mathcal{F})^T]$ the product σ -algebra on $V^T = \prod_{t \in T} V$. Let

$$\{X_t : (\Omega_X, \mathcal{A}_X, \mu_X) \longrightarrow (V, \mathcal{F})\}_{t \in T} \quad \text{and} \quad \{Y_t : (\Omega_Y, \mathcal{A}_Y, \mu_Y) \longrightarrow (V, \mathcal{F})\}_{t \in T}$$

be two stochastic processes with the same index set T and the same state space (V, \mathcal{F}) . Let

$$X : (\Omega_X, \mathcal{A}_X, \mu_X) \longrightarrow (V^T, \sigma[(V, \mathcal{F})^T]) \quad \text{and} \quad Y : (\Omega_Y, \mathcal{A}_Y, \mu_Y) \longrightarrow (V^T, \sigma[(V, \mathcal{F})^T])$$

be their respective $(V^T, \sigma[(V, \mathcal{F})^T])$ -valued random variables. Let $\mathcal{P}_X, \mathcal{P}_Y \in \mathcal{M}_1(V^T, \sigma[(V, \mathcal{F})^T])$ be the probability measures induced on $(V^T, \sigma[(V, \mathcal{F})^T])$ by X and Y , respectively. Then,

$$\mathcal{P}_X = \mathcal{P}_Y \in \mathcal{M}_1(V^T, \sigma[(V, \mathcal{F})^T])$$

if and only if

$$\mathcal{P}_{(X_{t_1}, X_{t_2}, \dots, X_{t_n})} = \mathcal{P}_{(Y_{t_1}, Y_{t_2}, \dots, Y_{t_n})} \in \mathcal{M}_1(V^n, \mathcal{F}^{\otimes n}), \quad \text{for each } n \in \mathbb{N} \text{ and pairwise distinct } t_1, t_2, \dots, t_n \in T.$$

PROOF

□

D Existence of a stochastic process given its finite-dimensional distributions: Komolgorov’s Existence Theorem

Definition D.1 (Stochastic processes)

Suppose $(\Omega, \mathcal{A}, \mu)$ is a probability space, (V, \mathcal{F}) is a measurable space, and T is an arbitrary non-empty set. A **stochastic process** indexed by T defined on Ω with codomain V is a family $\{X_t : \Omega \longrightarrow V\}_{t \in T}$ indexed by T of V -valued random variables defined on Ω .

Definition D.2 (Finite-dimensional distributions of a stochastic processes)

Let $\{X_t : \Omega \longrightarrow (V, \mathcal{F})\}_{t \in T}$ be a stochastic process. Let $n \in \mathbb{N}$ and $t_1, t_2, \dots, t_n \in T$ be distinct elements of T . The probability distribution induced on the product measurable space $(V^n, \mathcal{F}^{\otimes n})$ by $(X_{t_1}, X_{t_2}, \dots, X_{t_n}) : \Omega \longrightarrow V^n$ is called a **finite-dimensional distribution** of the stochastic process.

Definition D.3 (Komolgorov systems of finite-dimensional distributions & Komolgorov consistency)

Let T be an arbitrary non-empty set, and $\mathcal{D}(T)$ the set of all finite ordered sequences of elements of T whose elements are pairwise distinct; in other words,

$$\mathcal{D}(T) := \left\{ (t_1, t_2, \dots, t_n) \in \bigcup_{k=1}^{\infty} T^k \mid n \in \mathbb{N}, t_i \neq t_j, \text{ whenever } i \neq j \right\}.$$

For each $n \in \mathbb{N}$, let $\mathcal{M}_1(\mathbb{R}^n, \mathcal{B}(\mathbb{R}^n))$ be the set of all probability measures defined on the product measurable space $(\mathbb{R}^n, \mathcal{B}(\mathbb{R}^n))$. A **Komolgorov system of finite-dimensional distributions** is a $\mathcal{D}(T)$ -indexed family \mathcal{P} of probability measures of the following form:

$$\mathcal{P} = \{ P_{(t_1, \dots, t_n)} \in \mathcal{M}_1(\mathbb{R}^n, \mathcal{B}(\mathbb{R}^n)) \mid (t_1, \dots, t_n) \in \mathcal{D}(T) \}.$$

Furthermore, \mathcal{P} is said to be **Komolgorov consistent** if it satisfies both of the following conditions:

- **permutation invariance:** For any $n \in \mathbb{N}$, any $(t_1, \dots, t_n) \in \mathcal{D}(T)$, any $B_1, \dots, B_n \in \mathcal{B}(\mathbb{R})$, and any permutation $\pi : \{1, \dots, n\} \rightarrow \{1, \dots, n\}$, the following equality holds:

$$P_{(t_1, \dots, t_n)}(B_1 \times \dots \times B_n) = P_{(t_{\pi(1)}, \dots, t_{\pi(n)})}(B_{\pi(1)} \times \dots \times B_{\pi(n)}).$$

- **projection invariance:** For any $n \in \mathbb{N}$, any $(t_1, \dots, t_{n+1}) \in \mathcal{D}(T)$, and any $B_1, \dots, B_n \in \mathcal{B}(\mathbb{R})$, the following equality holds:

$$P_{(t_1, \dots, t_n, t_{n+1})}(B_1 \times \dots \times B_n \times \mathbb{R}) = P_{(t_1, \dots, t_n)}(B_1 \times \dots \times B_n).$$

Remark D.4

It is obvious that the collection of finite-dimensional distributions of any \mathbb{R} -valued stochastic process is a Komolgorov consistent Komolgorov system of finite-dimensional distributions.

Definition D.5

Let $\{X_t : \Omega \rightarrow \mathbb{R}\}_{t \in T}$ be an \mathbb{R} -valued stochastic process, and

$$\mathcal{P} = \{ P_{(t_1, \dots, t_n)} \in \mathcal{M}_1(\mathbb{R}^n, \mathcal{B}(\mathbb{R}^n)) \mid (t_1, \dots, t_n) \in \mathcal{D}(T) \}$$

be a Komolgorov system of finite-dimensional distributions. We say that **the stochastic process $\{X_t\}$ admits \mathcal{P} as its collection of finite-dimensional distributions** if, for each $n \in \mathbb{N}$ and any $(t_1, t_2, \dots, t_n) \in \mathcal{D}(T)$, the probability distribution induced on $(\mathbb{R}^n, \mathcal{B}(\mathbb{R}^n))$ by the map

$$(X_{t_1}, \dots, X_{t_n}) : \Omega \rightarrow \mathbb{R}^n$$

equals $P_{(t_1, \dots, t_n)} \in \mathcal{P}$.

Theorem D.6 (Komolgorov's Existence Theorem, Theorem 36.2, [2])

Let

$$\mathcal{P} = \{ P_{(t_1, \dots, t_n)} \in \mathcal{M}_1(\mathbb{R}^n, \mathcal{B}(\mathbb{R}^n)) \mid (t_1, \dots, t_n) \in \mathcal{D}(T) \}.$$

be a Komolgorov system of finite-dimensional distributions. Then, there exists a stochastic process

$$\{X_t : (\Omega, \mathcal{A}, \mu) \rightarrow (\mathbb{R}, \mathcal{B}(\mathbb{R}))\}_{t \in T}$$

which admits \mathcal{P} as its collection of finite-dimensional distributions if and only if \mathcal{P} is Komolgorov consistent.

E Gaussian Processes

Definition E.1 (Gaussian processes)

An \mathbb{R} -valued stochastic process $\{X_t : \Omega \rightarrow \mathbb{R}\}_{t \in T}$ is said to be **Gaussian** if each of its finite-dimensional distribution is a (univariate or multivariate) Gaussian distribution.

Definition E.2 (Mean and covariance functions of \mathbb{R} -valued stochastic processes)

Let $\{X_t : \Omega \rightarrow \mathbb{R}\}_{t \in T}$ be an \mathbb{R} -valued stochastic process.

- If, for each $t \in T$, we have $E(X_t) \in \mathbb{R}$, then the function

$$a_X : T \longrightarrow \mathbb{R} : t \longmapsto E(X_t)$$

is called the **mean** function of the \mathbb{R} -valued stochastic process $\{X_t\}$.

- In addition, if, for each $t_1, t_2 \in T$, we have $0 \leq \text{Cov}(X_{t_1}, X_{t_2}) < \infty$, then the function

$$\Sigma_X : T \times T \longrightarrow \mathbb{R} : (t_1, t_2) \longmapsto \text{Cov}(X_{t_1}, X_{t_2})$$

is called the **covariance** function of the \mathbb{R} -valued stochastic process $\{X_t\}$.

Theorem E.3

Let T be an arbitrary non-empty set, $a : T \longrightarrow \mathbb{R}$ an arbitrary \mathbb{R} -valued function defined on T , and $\Sigma : T \times T \longrightarrow [0, \infty)$ a non-negative \mathbb{R} -valued function defined on $T \times T$. Then, there exists a Gaussian process whose mean and covariance functions are a and Σ , respectively.

Theorem E.4

The mean and covariance functions of a Gaussian process together completely determine its collection of finite-dimensional distributions.

Definition E.5 (Brownian motion, a.k.a. Wiener process)

A **Brownian motion**, or **Wiener process**, is a stochastic process $\{W_t : (\Omega, \mathcal{A}, \mu) \longrightarrow \mathbb{R}\}_{t \geq 0}$ indexed by the non-negative real line satisfying the following conditions:

- At $t = 0$, the process takes value 0 with probability 1; more precisely:

$$P(W_0 = 0) = \mu(\{\omega \in \Omega \mid W_0(\omega) = 0\}) = 1.$$

- The process $\{W_t\}$ has independent increments; more precisely: for any $0 \leq t_1 \leq t_2 \leq \dots \leq t_n < \infty$,

$$W_{t_n} - W_{t_{n-1}}, \quad W_{t_{n-1}} - W_{t_{n-2}}, \quad \dots, \quad W_{t_2} - W_{t_1} : \Omega \longrightarrow \mathbb{R}$$

are independent random variables.

- For $0 \leq t_1 < t_2 < \infty$, the increment $W_{t_2} - W_{t_1}$ follows a Gaussian distribution with mean 0 and variance $t_2 - t_1$.

Definition E.6 (Brownian bridge)

A **Brownian bridge** is a Gaussian process $\{W_t^\circ : (\Omega, \mathcal{A}, \mu) \longrightarrow \mathbb{R}\}_{t \in [0, 1]}$ indexed by the closed unit interval in \mathbb{R} satisfying the following conditions:

- For each $t \in [0, 1]$, we have $E(W_t^\circ) = 0$.
- For any $t_1, t_2 \in [0, 1]$, we have $\text{Cov}(W_{t_1}^\circ, W_{t_2}^\circ) = \min\{t_1, t_2\} - t_1 t_2$.
