1 The Prokhorov Theorem

Definition 1.1 (Tightness and weak sequential compactness)

Suppose:

- (S, ρ) is a metric space, $\mathcal{B}(S)$ its the Borel σ -algebra, $(S, \mathcal{B}(S))$ is the corresponding measurable space.
- $\Pi \subset \mathcal{M}_1(S, \mathcal{B}(S))$ is a family of probability measures on $(S, \mathcal{B}(S))$.

The family Π is said to be:

(i) tight if, for each $\varepsilon > 0$, there exists a compact subset $K_{\varepsilon} \subset S$ such that

$$1 - \epsilon < P(K_{\varepsilon}) \le 1$$
, for each $P \in \Pi$.

(ii) weakly sequentially compact if, for every sequence $\{P_n\}_{n\in\mathbb{N}}\subset\Pi$, there exists a probability measure $P\in\mathcal{M}_1(S,\mathcal{B}(S))$ and subsequence $\{P_{n(i)}\}_{i\in\mathbb{N}}$ such that

$$P_{n(i)} \xrightarrow{w} P$$
, as $i \longrightarrow \infty$.

Theorem 1.2 (The Prokhorov Theorem, Theorems 5.1 & 5.2, [2])

Suppose:

- (S, ρ) is a metric space, $\mathcal{B}(S)$ its the Borel σ -algebra, $(S, \mathcal{B}(S))$ is the corresponding measurable space.
- $\Pi \subset \mathcal{M}_1(S, \mathcal{B}(S))$ is a collection of probability measures on $(S, \mathcal{B}(S))$.

Then, the following statements hold:

- (i) Tightness of Π implies weak sequential compactness of Π .
- (ii) Suppose further that (S, ρ) is complete and separable. Then, weak sequential compactness of Π implies tightness of Π .

PROOF We first prove statement (ii), then statement (i).

Proof of (ii)

Suppose S is complete and separable. Let $\varepsilon > 0$ be fixed. We need to find a compact subset $K \subset S$ such that

$$1-\varepsilon < P(K) < 1$$
, for each $P \in \Pi$.

Now, separability of S implies that every open cover of every subset of S admits a countable subcover (Appendix M3, [2]). Denote by $B(x,r) \subset S$ the open ball in S centred at $x \in S$ of radius r > 0. For each $k \in \mathbb{N}$, the open cover

$$\left\{ B\left(x,\frac{1}{k}\right) \right\}_{x \in S}$$

of S admits a countable subcover, say,

$$\{A_{ki}\}_{i\in\mathbb{N}} \subset \left\{B\left(x,\frac{1}{k}\right)\right\}_{x\in S}.$$

Let $G_{kn} := \bigcup_{i=1}^n A_{ki}$. Then, each G_{kn} is an open subset of S and $G_{kn} \uparrow S$, as $n \to \infty$. Hence, by the Claim below, there exists $n_k \in \mathbb{N}$ such that

$$1 - \frac{\varepsilon}{2^k} < P\left(\bigcup_{i=1}^{n_k} A_{ki}\right) \le 1$$
, for each $P \in \Pi$.

Now, let

$$K := \bigcap_{k=1}^{\infty} \bigcup_{i=1}^{n_k} A_{ki}$$

Note that K, being a closed subset of the complete metric space S, is itself complete. Note also that the set $\bigcap_{k=1}^{\infty} \bigcup_{i=1}^{n_k} A_{ki}$ is totally bounded; hence so is its closure K. Being complete and totally bounded, K is therefore compact (Appendix M5, [2]). It now remains only to show that $1-\varepsilon < P(K) \le 1$, for each $P \in \Pi$; or equivalently, that $P(K^c) \le \varepsilon$, for each $P \in \Pi$. To this end, write $B_k := \bigcup_{i=1}^{n_k} A_{ki}$. Then,

$$1 - \frac{\varepsilon}{2^k} < P(B_k) \le 1;$$
 equivalently, $P(B_k^c) \le \frac{\varepsilon}{2^k}$.

Also,

$$K := \bigcap_{k=1}^{\infty} \bigcup_{i=1}^{n_k} A_{ki} := \bigcap_{k=1}^{\infty} B_k \supset \bigcap_{k=1}^{\infty} B_k.$$

Hence,

$$K^c \subset \left(\bigcap_{k=1}^{\infty} B_k\right)^c = \bigcup_{k=1}^{\infty} B_k^c,$$

which implies:

$$P(K^c) \leq \sum_{k=1}^{\infty} P(B_k^c) \leq \sum_{k=1}^{\infty} \frac{\varepsilon}{2^k} = \varepsilon.$$

Thus, the proof of (ii) will be complete once we prove the following:

Claim: Let $\{G_n\}_{n\in\mathbb{N}}$ be a sequence of open subsets of S with $G_n \uparrow S$. Then, for each $\varepsilon > 0$, there exists $n_{\varepsilon} \in \mathbb{N}$ such that

$$1 - \varepsilon < P(G_{n_{\varepsilon}}) \le 1$$
, for each $P \in \Pi$.

Proof of Claim: Suppose the Claim is false, and we derive a contradiction. The failure of the Claim implies that there exists some $0 < \varepsilon < 1$ such that for each $n \in \mathbb{N}$, there exists $P_n \in \Pi$ such that

$$P_n(G_n) \leq 1-\varepsilon.$$

By the hypothesis of weak sequential compactness of Π , there exists some probability measure $Q \in \mathcal{M}_1(S, \mathcal{B}(S))$ and the subsequence $\{P_{n(i)}\}$ of $\{P_n\}$ such that $P_{n(i)} \xrightarrow{w} Q$, as $i \longrightarrow \infty$. Now, for each fixed $n \in \mathbb{N}$, we have:

$$Q(G_n) \leq \liminf_{i \to \infty} P_{n(i)}(G_n)$$
, by the Portmanteau Theorem
$$\leq \liminf_{i \to \infty} P_{n(i)}(G_{n(i)})$$
, since $\{G_n\}$ is increasing
$$\leq 1 - \varepsilon$$
, by choice of P_n

But, by hypothesis, we also have $G_n \uparrow S$. Hence, we therefore have:

$$1 = Q(S) = \lim_{n \to \infty} Q(G_n) \le 1 - \varepsilon,$$

which is the desired contradiction. This completes the proof of the Claim, hence that of (ii).

Proof of (i)

Suppose $\Pi \subset \mathcal{M}_1(S,\mathcal{B}(S))$ is tight. We need to establish that Π is weakly sequentially compact. In other words, if $\{P_n\} \subset \Pi$ is a sequence of probability measures contained in Π , we need to establish that there exists a Borel probability measure $P \in \mathcal{M}_1(S,\mathcal{B}(S))$ and a subsequence $\{P_{n(i)}\} \subset \{P_n\}$ such that $P_{n(i)} \xrightarrow{w} P$, as $i \longrightarrow \infty$.

So, let $\{P_n\} \subset \Pi$. We prove the Theorem by establishing the following series of Claims. Note that the proof of the Theorem is complete once we establish Claim 5.

Claim 1: There exists an increasing sequence of compact subsets $K_1 \subset K_2 \subset K_3 \subset \cdots \subset S$ such that

$$1 - \frac{1}{m} < P_n(K_m) \le 1$$
, for every $m, n \in \mathbb{N}$.

Claim 2: Let $K_1 \subset K_2 \subset K_3 \subset \cdots \subset S$ be one such sequence of compact subsets of S as in Claim 1. Then, the following statements are true:

- (i) $\Sigma := \bigcup_{m=1}^{\infty} K_m$ is a separable subset of S.
- (ii) There exists a countable collection \mathcal{A} of open subsets of S satisfying the following property: For each $x \in S$ and for each open subset G of S,

$$x \in G \cap \left(\bigcup_{m=1}^{\infty} K_m\right) \implies x \in A \subset \overline{A} \subset G, \text{ for some } A \in \mathcal{A}.$$

(iii) The collection \mathcal{A} is an open cover of Σ .

Claim 3: Define:

$$\mathcal{H} := \{\varnothing\} \bigcup \left\{\begin{array}{l} \text{all finite unions of sets of the form} \\ \overline{A} \cap K_m, \text{ where } A \in \mathcal{A} \text{ and } m \in \mathbb{N} \end{array}\right\}.$$

Then, there exists a subsequence $\{P_{n(i)}\}\subset\{P_n\}$ such that the limit

$$\alpha(H) := \lim_{i \to \infty} P_{n(i)}(H)$$
 exists, for each $H \in \mathcal{H}$.

Claim 4: There exists a Borel probability measure $P \in \mathcal{M}_1(S, \mathcal{B}(S))$ such that

$$P(G) = \sup \left\{ \alpha(H) \in [0,1] \mid \begin{array}{c} H \in \mathcal{H}, \text{ and} \\ H \subset G \end{array} \right\}, \text{ for each open subset } G \subset S.$$

(Note that the supremum above is always taken over a non-empty set: For each open $G \subset S$, the set $\{H \in \mathcal{H} \mid H \subset G\}$ is non-empty, since $\emptyset \in \mathcal{H}$.)

Claim 5: $P_{n(i)} \xrightarrow{w} P$, as $i \longrightarrow \infty$.

<u>Proof of Claim 1:</u> By tightness hypothesis on Π , for each $m \in \mathbb{N}$, there exists a compact subset $L_m \subset S$ such that

$$1 - \frac{1}{m} < P(L_m) \le 1$$
, for each $P \in \Pi$.

Define, for each $m \in \mathbb{N}$, $K_m := \bigcup_{i=1}^m L_i$. Then, each K_m is compact (since finite unions of compact subsets are themselves compact). Next, we trivially have $K_1 \subset K_2 \subset K_3 \subset \cdots \subset S$. Also,

$$P(K_m) = P\left(\bigcup_{i=1}^m L_i\right) \ge L_m > 1 - \frac{1}{m}, \text{ for each } P \in \Pi.$$

In particular, the above inequality holds for each P_n . This proves Claim 1.

<u>Proof of Claim 2:</u> Separability of $\Sigma := \bigcup_{m=1}^{\infty} K_m$ is an immediate consequence of Lemma A.1 and Lemma A.2. Then, the existence of \mathcal{A} follows immediately from the separability of Σ and Lemma A.3.

It remains to show that \mathcal{A} is an open cover of Σ . To this end, first note that the collection \mathcal{O}_S of open subsets of S forms an open cover of S, hence \mathcal{O}_S is also an open cover of Σ . Therefore, for each $x \in \Sigma$, we may choose $G_x \in \mathcal{O}_S$ such that $x \in G_x$. Thus, $x \in \Sigma \cap G_x$, and by properties of \mathcal{A} , we may furthermore choose $A_x \in \mathcal{A}$ such that $x \in A_x \subset \overline{A_x} \subset G_x$. We thus see that the collection

$$\left\{ A_x \in \mathcal{A} \mid x \in \Sigma \right\} \subset \mathcal{A}$$

is an open cover of Σ consisting of subsets in A. This completes the proof of Claim 2.

<u>Proof of Claim 3:</u> Note that \mathcal{H} is a countable collection of subsets of S. Let $\mathcal{H} = \{H_1, H_2, H_3, \dots\}$ be an enumeration of \mathcal{H} . Consider the following array of real numbers:

$$P_1(H_1)$$
 $P_2(H_1)$ $P_3(H_1)$ \cdots
 $P_1(H_2)$ $P_2(H_2)$ $P_3(H_2)$ \cdots
 $P_1(H_3)$ $P_2(H_3)$ $P_3(H_3)$ \cdots
 \vdots \vdots \vdots \vdots

Note that each row of the above array is bounded between 0 and 1. Hence, by Theorem A.4, there exists an increasing sequence

$$n(1) < n(2) < n(3) < \dots \in \mathbb{N}$$

of natural numbers such that the limit

$$\lim_{k \to \infty} P_{n(k)}(H_r), \text{ exists for each } r \in \mathbb{N}.$$

This completes the proof of Claim 3.

Proof of Claim 4:

<u>Proof of Claim 5:</u> Let $G \subset S$ be an arbitrary open subset of S. Then, for each $H \in \mathcal{H}$ with $H \subset G$, we have

$$\alpha(H) \ := \ \lim_{i \to \infty} P_{n(i)}(H) \ \le \ \liminf_{i \to \infty} \, P_{n(i)}(G).$$

The preceding inequality and Claim 4 together imply:

$$P(G) = \sup \left\{ \alpha(H) \in [0,1] \mid \begin{array}{c} H \in \mathcal{H}, \text{ and} \\ H \subset G \end{array} \right\} \leq \liminf_{i \to \infty} P_{n(i)}(G), \text{ for each open subset } G \subset S,$$

which is equivalent to the weak convergence $P_{n(i)} \xrightarrow{w} P$, as $i \to \infty$, by the Portmanteau Theorem (Theorem 2.1, [2]). This completes the proof of Claim 5.

A Technical Lemmas

Lemma A.1

Every compact subset of a metric space is also a separable subset of that metric space.

PROOF Let (X, ρ) be a metric space and $K \subset X$ be a compact subset of X. For each $x \in X$ and positive r > 0, let

$$B(x,r) := \{ y \in X \mid \rho(x,y) < r \} \subset X,$$

i.e. B(x,r) is the open ball in X centred at x with radius r>0. For each $n\in\mathbb{N}$, the following forms an open cover of K:

$$C_n := \left\{ B\left(x, \frac{1}{n}\right) \subset X \mid x \in K \right\}.$$

Since K is compact, each C_n admits a finite subcover:

$$\mathcal{F}_n := \left\{ B\left(x_i^{(n)}, \frac{1}{n}\right) \subset X \mid x_i^{(n)} \in K, \ i = 1, 2, \dots, J_n \right\}.$$

Let

$$\mathcal{D}_n := \left\{ x_i^{(n)} \in K \mid i = 1, 2, \dots, J_n \right\} \subset K,$$

and let $\mathcal{D} := \bigcup_{n=1}^{\infty} \mathcal{D}_n \subset K$. We claim that \mathcal{D} is dense in K. Indeed, let $y \in K$. Since each \mathcal{F}_n is a (finite) open cover of K, we have:

$$y \in K \subset \bigcup_{i=1}^{J_n} B\left(x_i^{(n)}, \frac{1}{n}\right), \text{ for each } n \in \mathbb{N}.$$

Since $x_i^{(n)} \in \mathcal{D}$, for each $i = 1, 2, ..., J_n$ and for each $n \in \mathbb{N}$, the above inclusion shows that, for each $n \in \mathbb{N}$, there exists some $x \in \mathcal{D}$ such that $\rho(y, x) < \frac{1}{n}$. In particular, \mathcal{D} contains a sequence that converges to $y \in K$. Since $y \in K$ is an arbitrary element of K, we see that $\overline{D} \supset K$. Since $\mathcal{D} \subset K$ and K is compact, hence closed, we trivially have $\overline{D} \subset K$. We may now conclude that $\overline{D} = K$. This completes the proof of the Lemma.

Lemma A.2

Every countable union of separable subsets of a metric space is itself a separable subset of that metric space.

PROOF Let $S:=\bigcup_{i=1}^{\infty}S_i\subset X$ be a countable union of separable subsets S_i of a metric space X. For each fixed $i\in\mathbb{N}$, since S_i is separable, there exists countable $D_i\subset S_i$ which is dense in S_i . Let $D:=\bigcup_{i=1}^{\infty}D_i$. Then, D is a countable subset of S. The Lemma is proved once we establish that D is dense in S. To this end, let $x\in S=\bigcup_{i=1}^{\infty}S_i$. Then, $x\in S_i$ for some $i\in\mathbb{N}$. Since D_i is dense in S_i , there exists a sequence $\{y_k\}\subset D_i\subset D$ such that $y_k\longrightarrow x$, as $k\longrightarrow \infty$. This proves that D is indeed dense in S, and completes the proof of the Lemma. \square

Lemma A.3 (second theorem in Appendix M3, [2])

Let (S, ρ) be a metric space and $\Sigma \subset S$ a separable subset of S. Then, there exists a countable collection A of open subsets of S satisfying the following property: For each $x \in S$ and each open subset G of S,

$$x \;\in\; G \;\bigcap\; \Sigma \quad\Longrightarrow\quad x \;\in\; A \;\subset\; \overline{A} \;\subset\; G, \; \text{ for some } A \in \mathcal{A}.$$

PROOF Let $D \subset \Sigma$ be a countable dense subset of Σ . Let

$$\mathcal{A} := \left\{ B(d,r) \subset S \middle| \begin{array}{c} d \in D, \\ r \in \mathbb{Q}, \ r > 0 \end{array} \right\}.$$

Then, \mathcal{A} is a countable collection of open balls in S. Now, let $G \subset S$ be an arbitrary open subset of S and $x \in G \cap \Sigma$. First, choose $\varepsilon > 0$ such that $B(x,\varepsilon) \subset G$. Next, since $x \in \Sigma$ and D is dense in Σ , we may choose $d \in D$ such that $d \in B(x,\varepsilon/2)$, or equivalently $\rho(x,d) < \varepsilon/2$. Finally choose positive rational r > 0 such that $\rho(x,d) < r < \varepsilon/2$.

Now, note that $\overline{B(d,r)} \subset B(x,\varepsilon)$; indeed,

$$y \in \overline{B(d,r)} \quad \Longleftrightarrow \quad \rho(y,d) \le r \quad \Longrightarrow \quad \rho(x,y) \ \le \ \rho(x,d) + \rho(d,y) \ < \ \varepsilon/2 + r \ < \ \varepsilon/2 + \varepsilon/2 \quad \Longrightarrow \quad y \in B(x,\varepsilon).$$

Thus, we have

$$x \in B(d,r) \subset \overline{B(d,r)} \subset B(x,\varepsilon) \subset G.$$

This completes the proof of the Lemma.

Theorem A.4 (The Diagonal Method, Appendix A.14, [1])

Suppose that each row of the array

is a bounded sequence of real numbers. Then, there exists an increasing sequence

$$n_1 < n_2 < n_3 < \cdots \in \mathbb{N}$$

of positive integers such that the limit

$$\lim_{k \to \infty} x_{r,n_k} \text{ exists, for each } r = 1, 2, 3, \dots$$

PROOF From the first row, select a convergent subsequence

$$x_{1,n(1,1)}, x_{1,n(1,2)}, x_{1,n(1,3)}, \cdots$$

Here, we have $n(1,1) < n(1,2) < n(1,3) < \cdots \in \mathbb{N}$, and $\lim_{k \to \infty} x_{1,n(1,k)} \in \mathbb{R}$ exists. Next, note that the following subsequence of the second row:

$$x_{2,n(1,1)}, x_{2,n(1,2)}, x_{2,n(1,3)}, \cdots$$

is still a bounded sequence of real numbers, and we may thus select a convergent subsequence:

$$x_{2,n(2,1)}, x_{2,n(2,2)}, x_{2,n(2,3)}, \cdots$$

Here, we have $n(2,1) < n(2,2) < n(2,3) < \cdots \in \{n(1,k)\}_{k \in \mathbb{N}}$, and $\lim_{k \to \infty} x_{2,n(2,k)} \in \mathbb{R}$ exists. Continuing inductively, we obtain an array of positive integers

$$n(1,1)$$
 $n(1,2)$ $n(1,3)$ \cdots $n(2,1)$ $n(2,2)$ $n(2,3)$ \cdots \vdots \vdots \vdots

which satisfies: For each $r \in \mathbb{N}$, we have

• each row is an increasing sequence of positive integers, i.e. $n(r,1) < n(r,2) < n(r,3) < \cdots$

Study Notes September 27, 2015 Kenneth Chu

- the $(r+1)^{\text{th}}$ row is a subsequence of the r^{th} row, i.e. $\{n(r+1,k)\}_{k\in\mathbb{N}}\subset \{n(r,k)\}_{k\in\mathbb{N}}$, and
- $\lim_{k \to \infty} x_{r,n(r,k)} \in \mathbb{R}$ exists.

Note that the first two properties together imply:

$$n(k,k) < n(k,k+1) \le n(k+1,k+1)$$
, for each $k \in \mathbb{N}$.

Now, define $n_k := n(k, k)$, for $k \in \mathbb{N}$. We then see that

$$n_k := n(k,k) < n(k+1,k+1) =: n_{k+1},$$

i.e., $\{n_k\}_{k\in\mathbb{N}}$ is a strictly increasing sequence of positive integers. Lastly, for each $r\in\mathbb{N}$, consider the sequence

$$x_{r,n_1}, x_{r,n_2}, x_{r,n_3}, \cdots$$

Note that, for each $r \in \mathbb{N}$,

$$x_{r,n_r}, x_{r,n_{r+1}}, x_{r,n_{r+2}}, \cdots$$

is a subsequence of $\{x_{r,n(r,k)}\}_{k\in\mathbb{N}}$. We saw above that $\lim_{k\to\infty}x_{r,n(r,k)}$ exists, which in turn implies that $\lim_{k\to\infty}x_{r,n_k}$ exists. Since $r\in\mathbb{N}$ is arbitrary, the proof of the Theorem is now complete.
