Some Asymptotic Theory for the Bootstrap

This set of notes aims to provide complete proofs of a number of asymptotic results regarding the Bootstrap [3] contained in Bickel and Freedman [1].

1   Bootstrap asymptotics for sample mean

Theorem 1.1 (Bootstrap Central Limit Theorem for I.I.D. sample mean, Theorem 2.1 [1])

Let $(\Omega, \mathcal{A}, \nu)$ be a probability space. Let $X, X_1, X_2, \ldots : \Omega \longrightarrow \mathbb{R}$ be a sequence of independent and identically distributed $\mathbb{R}$-valued random variables defined on Ω with finite expectation value $\mu_X \in \mathbb{R}$ and variance $\sigma_X^2 < \infty$. For each $n \in \mathbb{N}$ be fixed, define:

$$\overline{X}_n \; : \; \Omega \; \longrightarrow \; \mathbb{R} \; : \; \omega \; \longmapsto \; \frac{1}{n} \sum_{i=1}^{n} X_i(\omega).$$

For $n, m \in \mathbb{N}$, define $\mathcal{S}_m^{(n)}$ to be the set of all functions from $\{1, 2, \ldots, m\} \longrightarrow \{1, 2, \ldots, n\}$. Thus, each

$$s \; = \; (s(1), s(2), \ldots, s(m)) \; \in \; \mathcal{S}_m^{(n)}$$

can be regarded as a length-m finite (ordered) sequence of positive integers between 1 and n, inclusive. Note that $\mathcal{S}_m^{(n)}$ is a finite set with $|\, \mathcal{S}_m^{(n)} \,| = n^m$. Endow $\mathcal{S}_m^{(n)}$ with the probability space structure induced by the uniform probability function:

$$P_{\mathcal{S}_m^{(n)}}(s) \; := \; \frac{1}{n^m}, \quad \text{for each } s \in \mathcal{S}_m^{(n)}.$$

Let $\Omega \times \mathcal{S}_m^{(n)}$ be the product probability space of Ω and $\mathcal{S}_m^{(n)}$. Define:

$$\overline{X}_m^{(n)} \; : \; \Omega \times \mathcal{S}_m^{(n)} \; \longrightarrow \; \mathbb{R} \; : \; (\omega, s) \; \longmapsto \; \frac{1}{m} \sum_{j=1}^{n} X_{s(j)}(\omega).$$

For each $\omega \in \Omega$, define:

$$\Phi_{m,\omega}^{(n)} \; : \; \mathcal{S}_m^{(n)} \; \longrightarrow \; \mathbb{R} \; : \; s \; \longmapsto \; \sqrt{m} \left(\overline{X}_m^{(n)}(\omega, s) - \overline{X}_n(\omega) \right)$$

Then,

$$P \left(\Phi_{m,\omega}^{(n)} \xrightarrow{d} N(0, \sigma_X^2), \text{ as } n, m \to \infty \right) \; = \; \nu \left(\left\{ \omega \in \Omega \; \middle| \; \Phi_{m,\omega}^{(n)} \xrightarrow{d} N(0, \sigma_X^2), \text{ as } n, m \to \infty \right\} \right) \; = \; 1.$$

Remark 1.2

*For each fixed $\omega \in \Omega$, $\left\{ \Phi_{m,\omega}^{(n)} : \mathcal{S}_m^{(n)} \longrightarrow \mathbb{R} \right\}_{n,m \in \mathbb{N}}$ is a doubly indexed sequence of $\mathbb{R}$-valued random variables. Note that their respective domains $\mathcal{S}_m^{(n)}$ are pairwise distinct probability spaces. The **Bootstrap Central Limit Theorem for I.I.D. sample mean** asserts that for almost every $\omega \in \Omega$, the doubly indexed sequence $\left\{ \Phi_{m,\omega}^{(n)} \right\}$ of $\mathbb{R}$-valued random variables converges in distribution to $N(0, \sigma_X^2)$ as $n, m \longrightarrow \infty$.*

Remark 1.3   *The following results are well known from classical asymptotic theory:*

*By the **Weak Law of Large Numbers**, $\overline{X}_n$ converges in probability to μ_X, as $n \longrightarrow \infty$; in other words,*

$$\lim_{n \to \infty} P\left(\left| \overline{X}_n - \mu_X \right| > \varepsilon \right) \; = \; \lim_{n \to \infty} \nu \left(\left\{ \omega \in \Omega \; : \; \left| \overline{X}_n(\omega) - \mu_X \right| > \varepsilon \right\} \right) \; = \; 0, \quad \text{for each } \varepsilon > 0.$$

*By the **Strong Law of Large Numbers**, $\overline{X}_n$ converges almost surely to μ_X, as $n \longrightarrow \infty$; in other words,*

$$P\left(\lim_{n \to \infty} \overline{X}_n = \mu_X \right) \; = \; \nu \left(\left\{ \omega \in \Omega \; \middle| \; \lim_{n \to \infty} \overline{X}_n(\omega) = \mu_X \right\} \right) \; = \; 1.$$

*By the **Central Limit Theorem**, $\sqrt{n} \left(\overline{X}_n - \mu_X \right)$ converges in distribution to $N(0, \sigma_X^2)$.*

A   A stochastic process $\{ X_t : \Omega \longrightarrow V \}_{t \in T}$ and its equivalent V^T-valued random variable $X : \Omega \longrightarrow V^T$

Let Ω, T, and V be non-empty sets. Let $\{ X_t : \Omega \longrightarrow V \}_{t \in T}$ be a T-index family of maps, each of which maps from Ω into V. Note that this family of maps is set-theoretically equivalent (in the sense that either completely determines the other) to the following (V^T)-valued map defined on Ω:

$$ X \,:\, \Omega \,\longrightarrow\, V^T \,:\, \omega \,\longmapsto\, (t \longmapsto X_t(\omega))\,, $$

where $V^T = \prod_{t \in T} V$ denotes the set of all (arbitrary) V-valued functions defined on T. In this section, we aim to establish the following two results:

- Suppose $(\Omega, \mathcal{A})$ and $(V, \mathcal{F})$ are measurable space structures on Ω and V, respectively. Then, $X : \Omega \longrightarrow V^T$ is $\left(\mathcal{A}, \sigma[(V, \mathcal{F})^T] \right)$-measurable if and only if $X_t : \Omega \longrightarrow V$ is $(\mathcal{A}, \mathcal{F})$-measurable for each $t \in T$. Here, $\sigma[(V, \mathcal{F})^T]$ denotes the product σ-algebra on V^T, which is by definition the smallest σ-algebra on V^T such that, for each $t \in T$, the projection map (or evaluation map)

$$ \pi_t \,:\, V^T \,\longrightarrow\, V \,:\, x \,\longmapsto\, x(t) $$

  is $\left(\sigma[(V, \mathcal{F})^T], \mathcal{F} \right)$-measurable.

- An immediate corollary of the above result is that: Suppose $(\Omega, \mathcal{A}, \mu)$ is a probability space structure on Ω, $(V, \mathcal{F})$ is a measurable space structure on V, and $\sigma[(V, \mathcal{F})^T]$ is the product σ-algebra on V^T. Then, $X : (\Omega, \mathcal{A}, \mu) \longrightarrow (V^T, \sigma[(V, \mathcal{F})^T])$ is V^T-valued random variable if and only if $\{ X_t : (\Omega, \mathcal{A}, \mu) \longrightarrow (V, \mathcal{F}) \}_{t \in T}$ is a stochastic process.

Definition A.1 (The product σ-algebra of a Cartesian product of measurable spaces)

Let T be an arbitrary non-empty set. For each $t \in T$, let $(V_t, \mathcal{F}_t)$ be a measurable space (in particular, $V_t \neq \varnothing$). Let $\prod_{t \in T} V_t$ be the Cartesian product of $\{ V_t \}_{t \in T}$. In other words,

$$ \prod_{t \in T} V_t \;:=\; \left\{ \; v : T \longrightarrow \bigsqcup_{t \in T} V_t \;\middle|\; v(t) \in V_t, \text{ for each } t \in T \; \right\}. $$

That $\prod_{t \in T} V_t \neq \varnothing$ follows from the Axiom of Choice. For each $t \in T$, let

$$ \pi_t \,:\, \prod_{\tau \in T} V_\tau \,\longrightarrow\, V_t \,:\, v \,\longmapsto\, v(t) $$

*be the projection map from $\prod_{\tau \in T} V_\tau$ onto V_t. The **product σ-algebra** on $\prod_{t \in T} V_t$ is the following:*

$$ \sigma\!\left(\left\{ \; \pi_t^{-1}(F) \subset \prod_{\tau \in T} V_\tau \;\middle|\; F \in \mathcal{F}_t \,,\, t \in T \; \right\} \right) \;\subset\; \mathrm{PowerSet}\!\left(\prod_{t \in T} V_t \right). $$

Clearly, it is the smallest σ-algebra on $\prod_{t \in T} V_t$ with respect to which each projection map $\pi_t : \prod_{t \in T} V_t \longrightarrow (V_t, \mathcal{F}_t)$ is measurable. We denote the product σ-algebra on $\prod_{t \in T} V_t$ by

$$ \sigma\!\left(\prod_{t \in T} (V_t, \mathcal{F}_t) \right) $$

Theorem A.2

Suppose Ω, T, and V are non-empty sets. Let $\{ X_t : \Omega \longrightarrow V \}_{t \in T}$ be a T-index family of maps, each of which maps from Ω into V. Then,

1. The family $\{ X_t : \Omega \longrightarrow V \}_{t \in T}$ of maps is set-theoretically equivalent (in the sense that either completely determines the other) to the following (V^T)-valued map defined on Ω:

$$X \ : \ \Omega \ \longrightarrow \ V^T \ : \ \omega \ \longmapsto \ (t \longmapsto X_t(\omega)),$$

where $V^T = \prod_{t \in T} V$ denotes the set of all (arbitrary) V-valued functions defined on T.

2. Suppose $(\Omega, \mathcal{A})$ and $(V, \mathcal{F})$ are measurable space structures on Ω and V respectively, and $\sigma[(V, \mathcal{F})^T]$ denotes the corresponding product σ-algebra on V^T. Then, $X : \Omega \longrightarrow V^T$ is $\big(\mathcal{A}, \sigma[(V, \mathcal{F})^T]\big)$-measurable if and only if $X_t : \Omega \longrightarrow V$ is $(\mathcal{A}, \mathcal{F})$-measurable for each $t \in T$.

PROOF   The proof of the first statement is routine and we omit it. We now prove the second statement. Suppose $X : \Omega \longrightarrow V^T$ is $(\mathcal{A}, \sigma[(V, \mathcal{F})^T])$-measurable. Note that $X_t = \pi_t \circ X$, where $\pi_t : \prod_{t \in T} V \longrightarrow V$ is the projection from $V^T = \prod_{\tau \in T} V$ onto the t-th factor. By construction of the product σ-algebra $\sigma[(V, \mathcal{F})^T]$ on V^T, $\pi_t : V^T \longrightarrow V$ is $(\sigma[(V, \mathcal{F})^T], \mathcal{F})$-measurable for each $t \in T$. This implies, for each $t \in T$, $X_t = \pi_t \circ X$ is $(\mathcal{A}, \mathcal{F})$-measurable, being a composition of two measurable maps. Conversely, suppose X_t is $(\mathcal{A}, \mathcal{F})$-measurable for each $t \in T$. Recall that the product σ-algebra on V^T is generated by sets of the form:

$$\pi_t^{-1}(F), \ \text{ for some } t \in T \text{ and } F \in \mathcal{F}.$$

It follows that, for each $t \in T$ and each $F \in \mathcal{F}$, we have

$$X^{-1}\big(\pi_t^{-1}(F)\big) \ = \ (X^{-1} \circ \pi_t^{-1})(F) \ = \ (\pi_t \circ X)^{-1}(F) \ = \ X_t^{-1}(F) \ \subset \ \Omega$$

is $\mathcal{A}$-measurable, since $X_t : (\Omega, \mathcal{A}) \longrightarrow (V, \mathcal{F})$ is $(\mathcal{A}, \mathcal{F})$-measurable by hypothesis. This proves that $X : \Omega \longrightarrow U$ is $(\mathcal{A}, \sigma[(V, \mathcal{F})^T])$-measurable. $\square$

Definition A.3 (Stochastic processes)

Suppose $(\Omega, \mathcal{A}, \mu)$ is a probability space, $(V, \mathcal{F})$ is a measurable space, and T is an arbitrary non-empty set. A **stochastic process indexed by** T **defined on** $(\Omega, \mathcal{A}, \mu)$ **with state space** $(V, \mathcal{F})$ is a family

$$\{ X_t \ : \ (\Omega, \mathcal{A}, \mu) \ \longrightarrow \ (V, \mathcal{F}) \ \}_{t \in T}$$

indexed by T of V-valued $(\mathcal{A}, \mathcal{F})$-measurable maps from Ω into V.

Corollary A.4

Suppose Ω, T, V are non-empty sets, $(\Omega, \mathcal{A}, \mu)$ is a probability space structure on Ω, $(V, \mathcal{F})$ is a measurable space structure on V, and $\sigma[(V, \mathcal{F})^T]$ denotes the corresponding product σ-algebra on $V^T = \prod_{t \in T} V$. Let $\{ X_t : \Omega \longrightarrow V \}_{t \in T}$ be a T-index family of maps, each of which maps from Ω into V, and let

$$X \ : \ \Omega \ \longrightarrow \ V^T \ : \ \omega \ \longmapsto \ (t \longmapsto X_t(\omega))$$

be its set-theoretically equivalent (V^T)-valued map defined on Ω. Then,

$$\{ X_t \ : \ (\Omega, \mathcal{A}, \mu) \ \longrightarrow \ (V, \mathcal{F}) \ \}_{t \in T}$$

is a stochastic process if and only if

$$X \ : \ (\Omega, \mathcal{A}, \mu) \ \longrightarrow \ \big(V^T, \sigma[(V, \mathcal{F})^T]\big)$$

is a (V^T)-valued random variable.

B   Uniqueness of the "full distribution" of a stochastic process $\{\, X_t :$ $\Omega \longrightarrow V \,\}_{t \in T}$ given its finite-dimensional distributions

In this section, we state the precise sense in which the finite-dimensional distributions of a stochastic process completely determine the "full distribution" of the stochastic process.

First, let Ω, T, and V be non-empty sets. Let $\{\, X_t : \Omega \longrightarrow V \,\}_{t \in T}$ be a T-index family of maps, each of which maps from Ω into V. Note that this family of maps is set-theoretically equivalent (in the sense that either completely determines the other) to the following (V^T)-valued map defined on Ω:

$$X \,:\, \Omega \,\longrightarrow\, V^T \,:\, \omega \,\longmapsto\, (t \longmapsto X_t(\omega)),$$

where $V^T = \prod_{t \in T} V$ denotes the set of all (arbitrary) V-valued functions defined on T.

Next, suppose $(\Omega, \mathcal{A}, \mu)$ is a probability space structure on Ω, and $(V, \mathcal{F})$ is a measurable space structure on V. It will be shown that $X : \Omega \longrightarrow V^T$ is $\big(\mathcal{A}, \sigma[(V, \mathcal{F})^T]\big)$-measurable if and only if $X_t : \Omega \longrightarrow V$ is $(\mathcal{A}, \mathcal{F})$-measurable for each $t \in T$. Here, $\sigma[(V, \mathcal{F})^T]$ denotes the product σ-algebra on V^T, which is by definition the smallest σ-algebra on V^T such that, for each $t \in T$, the projection map (or evaluation map)

$$\pi_t \,:\, V^T \,\longrightarrow\, V \,:\, x \,\longmapsto\, x(t)$$

is $\big(\sigma[(V, \mathcal{F})^T], \mathcal{F}\big)$-measurable.

The result we aim to state precisely and prove is the following: The finite-dimensional distributions of a stochastic process $\{\, X_t : (\Omega, \mathcal{A}, \mu) \longrightarrow (V, \mathcal{F}) \,\}_{t \in T}$ completely determines the distribution of its associated (V^T)-valued random variable $X : (\Omega, \mathcal{A}, \mu) \longrightarrow (V^T, \sigma[(V, \mathcal{F})^T])$.

Definition B.1 (Stochastic processes)
*Suppose $(\Omega, \mathcal{A}, \mu)$ is a probability space, $(V, \mathcal{F})$ is a measurable space, and T is an arbitrary non-empty set. A **stochastic process indexed by T defined on** $(\Omega, \mathcal{A}, \mu)$ **with state space** $(V, \mathcal{F})$ is a family*

$$\{\, X_t \,:\, (\Omega, \mathcal{A}, \mu) \,\longrightarrow\, (V, \mathcal{F}) \,\}_{t \in T}$$

indexed by T of V-valued $(\mathcal{A}, \mathcal{F})$-measurable maps from Ω into V.

Definition B.2 (The product σ-algebra of a Cartesian product of measurable spaces)
Let T be an arbitrary non-empty set. For each $t \in T$, let $(V_t, \mathcal{F}_t)$ be a measurable space (in particular, $V_t \neq \varnothing$). Let $\prod_{t \in T} V_t$ be the Cartesian product of $\{\, V_t \,\}_{t \in T}$. In other words,

$$\prod_{t \in T} V_t \;:=\; \left\{\, v : T \longrightarrow \bigsqcup_{t \in T} V_t \;\middle|\; v(t) \in V_t, \text{ for each } t \in T \,\right\}.$$

That $\prod_{t \in T} V_t \neq \varnothing$ follows from the Axiom of Choice. For each $t \in T$, let

$$\pi_t \,:\, \prod_{\tau \in T} V_\tau \,\longrightarrow\, V_t \,:\, v \,\longmapsto\, v(t)$$

*be the projection map from $\prod_{\tau \in T} V_\tau$ onto V_t. The **product σ-algebra** on $\prod_{t \in T} V_t$ is the following:*

$$\sigma\left(\left\{\, \pi_t^{-1}(F) \subset \prod_{\tau \in T} V_\tau \;\middle|\; F \in \mathcal{F}_t \,,\, t \in T \,\right\}\right) \;\subset\; \mathrm{PowerSet}\left(\prod_{t \in T} V_t\right).$$

Clearly, it is the smallest σ-algebra on $\prod_{t \in T} V_t$ with respect to which each projection map $\pi_t : \prod_{t \in T} V_t \longrightarrow (V_t, \mathcal{F}_t)$ is measurable. We denote the product σ-algebra on $\prod_{t \in T} V_t$ by

$$\sigma\left(\prod_{t \in T} (V_t, \mathcal{F}_t)\right)$$

Proposition B.3

Suppose Ω, T, and V are non-empty sets. Let $\{ X_t : \Omega \longrightarrow V \}_{t \in T}$ be a T-index family of maps, each of which maps from Ω into V. Then,

1. *The family $\{ X_t : \Omega \longrightarrow V \}_{t \in T}$ of maps is set-theoretically equivalent (in the sense that either completely determines the other) to the following (V^T)-valued map defined on Ω:*

$$X : \Omega \longrightarrow V^T : \omega \longmapsto (t \longmapsto X_t(\omega)),$$

   where $V^T = \prod_{t \in T} V$ denotes the set of all (arbitrary) V-valued functions defined on T.

2. *Suppose $(\Omega, \mathcal{A}, \mu)$ is a probability space structure on Ω, $(V, \mathcal{F})$ is a measurable space structure on V, and $\sigma[(V, \mathcal{F})^T]$ denotes the corresponding product σ-algebra on V^T. Then, $X : \Omega \longrightarrow V^T$ is $\big(\mathcal{A}, \sigma[(V, \mathcal{F})^T]\big)$-measurable if and only if $X_t : \Omega \longrightarrow V$ is $(\mathcal{A}, \mathcal{F})$-measurable for each $t \in T$.*

PROOF   The proof of the first statement is routine and we omit it. We now prove the second statement. Suppose $X : \Omega \longrightarrow V^T$ is $(\mathcal{A}, \sigma[(V, \mathcal{F})^T])$-measurable. Note that $X_t = \pi_t \circ X$, where $\pi_t : \prod_{t \in T} V \longrightarrow V$ is the projection from $V^T = \prod_{\tau \in T} V$ onto the t-th factor. By construction of the product σ-algebra $\sigma[(V, \mathcal{F})^T]$ on V^T, $\pi_t : V^T \longrightarrow V$ is $(\sigma[(V, \mathcal{F})^T], \mathcal{F})$-measurable for each $t \in T$. This implies, for each $t \in T$, $X_t = \pi_t \circ X$ is $(\mathcal{A}, \mathcal{F})$-measurable, being a composition of two measurable maps. Conversely, suppose X_t is $(\mathcal{A}, \mathcal{F})$-measurable for each $t \in T$. Recall that the product σ-algebra on V^T is generated by sets of the form:

$$\pi_t^{-1}(F), \ \text{ for some } t \in T \text{ and } F \in \mathcal{F}.$$

It follows that, for each $t \in T$ and each $F \in \mathcal{F}$, we have

$$X^{-1}\big(\pi_t^{-1}(F)\big) \ = \ (X^{-1} \circ \pi_t^{-1})(F) \ = \ (\pi_t \circ X)^{-1}(F) \ = \ X_t^{-1}(F) \ \subset \ \Omega$$

is $\mathcal{A}$-measurable, since $X_t : (\Omega, \mathcal{A}) \longrightarrow (V, \mathcal{F})$ is $(\mathcal{A}, \mathcal{F})$-measurable by hypothesis. This proves that $X : \Omega \longrightarrow U$ is $(\mathcal{A}, \sigma[(V, \mathcal{F})^T])$-measurable. □

Corollary B.4

Suppose Ω, T, V are non-empty sets, $(\Omega, \mathcal{A}, \mu)$ is a probability space structure on Ω, $(V, \mathcal{F})$ is a measurable space structure on V, and $\sigma[(V, \mathcal{F})^T]$ denotes the corresponding product σ-algebra on $V^T = \prod_{t \in T} V$. Let $\{ X_t : \Omega \longrightarrow V \}_{t \in T}$ be a T-index family of maps, each of which maps from Ω into V, and let

$$X : \Omega \longrightarrow V^T : \omega \longmapsto (t \longmapsto X_t(\omega))$$

be its set-theoretically equivalent (V^T)-valued map defined on Ω. Then,

$$\{ X_t : (\Omega, \mathcal{A}, \mu) \longrightarrow (V, \mathcal{F}) \}_{t \in T}$$

is a stochastic process if and only if

$$X : (\Omega, \mathcal{A}, \mu) \longrightarrow \big(V^T, \sigma[(V, \mathcal{F})^T]\big)$$

is a (V^T)-valued random variable.

Definition B.5 (Finite-dimensional distributions of a stochastic processes)
*Let $\{ X_t : (\Omega, \mathcal{A}, \mu) \longrightarrow (V, \mathcal{F}) \}_{t \in T}$ be a stochastic process. Let $n \in \mathbb{N}$ and $t_1, t_2, \ldots, t_n \in T$ be distinct elements of T. The probability distribution induced on the product measurable space $(V^n, \mathcal{F}^{\otimes n})$ by $(X_{t_1}, X_{t_2}, \ldots, X_{t_n}) : \Omega \longrightarrow V^n$ is called a **finite-dimensional distribution** of the stochastic process.*

C   Existence of a stochastic process given its finite-dimensional distributions: Komolgorov's Existence Theorem

Definition C.1 (Stochastic processes)
*Suppose $(\Omega, \mathcal{A}, \mu)$ is a probability space, $(V, \mathcal{F})$ is a measurable space, and T is an arbitrary non-empty set. A **stochastic process** indexed by T defined on Ω with codomain V is a family $\{ X_t : \Omega \longrightarrow V \}_{t \in T}$ indexed by T of V-valued random variables defined on Ω.*

Definition C.2 (Finite-dimensional distributions of a stochastic processes)
*Let $\{ X_t : \Omega \longrightarrow (V, \mathcal{F}) \}_{t \in T}$ be a stochastic process. Let $n \in \mathbb{N}$ and $t_1, t_2, \ldots, t_n \in T$ be distinct elements of T. The probability distribution induced on the product measurable space $(V^n, \mathcal{F}^{\otimes n})$ by $(X_{t_1}, X_{t_2}, \ldots, X_{t_n}) : \Omega \longrightarrow V^n$ is called a **finite-dimensional distribution** of the stochastic process.*

Definition C.3 (Komolgorov systems of finite-dimensional distributions & Komolgorov consistency)
Let T be an arbitrary non-empty set, and $\mathcal{D}(T)$ the set of all finite ordered sequences of elements of T whose elements are pairwise distinct; in other words,

$$\mathcal{D}(T) := \left\{ (t_1, t_2, \ldots, t_n) \in \bigcup_{k=1}^{\infty} T^k \;\middle|\; n \in \mathbb{N},\; t_i \neq t_j,\; \text{whenever } i \neq j \right\}.$$

*For each $n \in \mathbb{N}$, let $\mathcal{M}_1(R^n, \mathcal{B}(\mathbb{R}^n))$ be the set of all probability measures defined on the product measurable space $(\mathbb{R}^n, \mathcal{B}(\mathbb{R}^n))$. A **Komolgorov system of finite-dimensional distributions** is a $\mathcal{D}(T)$-indexed family $\mathcal{P}$ of probability measures of the following form:*

$$\mathcal{P} = \left\{ P_{(t_1, \ldots, t_n)} \in \mathcal{M}_1(\mathbb{R}^n, \mathcal{B}(\mathbb{R}^n)) \;\middle|\; (t_1, \ldots, t_n) \in \mathcal{D}(T) \right\}.$$

*Furthermore, $\mathcal{P}$ is said to be **Komolgorov consistent** if it satisfies both of the following conditions:*

- **permutation invariance:** *For any $n \in \mathbb{N}$, any $(t_1, \ldots, t_n) \in \mathcal{D}(T)$, any $B_1, \ldots, B_n \in \mathcal{B}(\mathbb{R})$, and any permutation $\pi : \{1, \ldots, n\} \longrightarrow \{1, \ldots, n\}$, the following equality holds:*

$$P_{(t_1, \ldots, t_n)}(B_1 \times \cdots \times B_n) = P_{(t_{\pi(1)}, \ldots, t_{\pi(n)})}\big(B_{\pi(1)} \times \cdots \times B_{\pi(n)}\big).$$

- **projection invariance:** *For any $n \in \mathbb{N}$, any $(t_1, \ldots, t_{n+1}) \in \mathcal{D}(T)$, and any $B_1, \ldots, B_n \in \mathcal{B}(\mathbb{R})$, the following equality holds:*

$$P_{(t_1, \ldots, t_n, t_{n+1})}(B_1 \times \cdots \times B_n \times \mathbb{R}) = P_{(t_1, \ldots, t_n)}(B_1 \times \cdots \times B_n).$$

Remark C.4
It is obvious that the collection of finite-dimensional distributions of any $\mathbb{R}$-valued stochastic process is a Komolgorov consistent Komolgorov system of finite-dimensional distributions.

Definition C.5
Let $\{ X_t : \Omega \longrightarrow \mathbb{R} \}_{t \in T}$ be an $\mathbb{R}$-valued stochastic process, and

$$\mathcal{P} = \left\{ P_{(t_1, \ldots, t_n)} \in \mathcal{M}_1(\mathbb{R}^n, \mathcal{B}(\mathbb{R}^n)) \;\mid\; (t_1, \ldots, t_n) \in \mathcal{D}(T) \right\}$$

*be a Komolgorov system of finite-dimensional distributions. We say that **the stochastic process $\{ X_t \}$ admits $\mathcal{P}$ as its collection of finite-dimensional distributions** if, for each $n \in \mathbb{N}$ and any $(t_1, t_2, \ldots, t_n) \in \mathcal{D}(T)$, the probability distribution induced on $(\mathbb{R}^n, \mathcal{B}(\mathbb{R}^n))$ by the map*

$$(X_{t_1}, \ldots, X_{t_n}) : \Omega \longrightarrow \mathbb{R}^n$$

equals $P_{(t_1, \ldots, t_n)} \in \mathcal{P}$.

Theorem C.6 (Komolgorov's Existence Theorem, Theorem 36.2, [2])
Let
$$\mathcal{P} \ = \ \left\{ \ P_{(t_1,\ldots,t_n)} \in \mathcal{M}_1(\mathbb{R}^n, \mathcal{B}(\mathbb{R}^n)) \ \middle| \ (t_1,\ldots,t_n) \in \mathcal{D}(T) \ \right\}.$$
be a Komolgorov system of finite-dimensional distributions. Then, there exists a stochastic process
$$\left\{ \ X_t : (\Omega, \mathcal{A}, \mu) \ \longrightarrow \ (\mathbb{R}, \mathcal{B}(\mathbb{R})) \ \right\}_{t \in T}$$
which admits $\mathcal{P}$ as its collection of finite-dimensional distributions if and only if $\mathcal{P}$ is Komolgorov consistent.

D   Gaussian Processes

Definition D.1 (Gaussian processes)
*An $\mathbb{R}$-valued stochastic process $\left\{ \ X_t : \Omega \longrightarrow \mathbb{R} \ \right\}_{t \in T}$ is said to be **Gaussian** if each of its finite-dimensional distribution is a (univariate or multivariate) Gaussian distribution.*

Definition D.2 (Mean and covariance functions of $\mathbb{R}$-valued stochastic processes)
Let $\left\{ \ X_t : \Omega \longrightarrow \mathbb{R} \ \right\}_{t \in T}$ be an $\mathbb{R}$-valued stochastic process.

- *If, for each $t \in T$, we have $E(X_t) \in \mathbb{R}$, then the function*

$$a_X \ : \ T \ \longrightarrow \ \mathbb{R} \ : \ t \ \longmapsto \ E(X_t)$$

  *is called the **mean** function of the $\mathbb{R}$-valued stochastic process $\{X_t\}$.*

- *In addition, if, for each $t_1, t_2 \in T$, we have $0 \leq \mathrm{Cov}(X_{t_1}, X_{t_2}) < \infty$, then the function*

$$\Sigma_X \ : \ T \times T \ \longrightarrow \ \mathbb{R} \ : \ (t_1, t_2) \ \longmapsto \ \mathrm{Cov}(X_{t_1}, X_{t_2})$$

  *is called the **covariance** function of the $\mathbb{R}$-valued stochastic process $\{X_t\}$.*

Theorem D.3
Let T be an arbitrary non-empty set, $a : T \longrightarrow \mathbb{R}$ an arbitrary $\mathbb{R}$-valued function defined on T, and $\Sigma : T \times T \longrightarrow [0, \infty)$ a non-negative $\mathbb{R}$-valued function defined on $T \times T$. Then, there exists a Gaussian process whose mean and covariance functions are a and Σ, respectively.

Theorem D.4
The mean and covariance functions of a Gaussian process together completely determine its collection of finite-dimensional distributions.

Definition D.5 (Brownian motion, a.k.a. Wiener process)
*A **Brownian motion**, or **Wiener process**, is a stochastic process $\left\{ W_t : (\Omega, \mathcal{A}, \mu) \longrightarrow \mathbb{R} \right\}_{t \geq 0}$ indexed by the non-negative real line satisfying the following conditions:*

- *At $t = 0$, the process takes value 0 with probability 1; more precisely:*

$$P(W_0 = 0) \ = \ \mu(\{ \ \omega \in \Omega \mid W_0(\omega) = 0 \ \}) \ = \ 1.$$

- *The process $\{W_t\}$ has independent increments; more precisely: for any $0 \leq t_1 \leq t_2 \leq \cdots \leq t_n < \infty$,*

$$W_{t_n} - W_{t_{n-1}}, \quad W_{t_{n-1}} - W_{t_{n-2}}, \quad \ldots \ , \quad W_{t_2} - W_{t_1} \ : \ \Omega \longrightarrow \mathbb{R}$$

  are independent random variables.

- *For $0 \leq t_1 < t_2 < \infty$, the increment $W_{t_2} - W_{t_1}$ follows a Gaussian distribution with mean 0 and variance $t_2 - t_1$.*

Definition D.6 (Brownian bridge)

*A **Brownian bridge** is a Gaussian process $\{W_t^\circ : (\Omega, \mathcal{A}, \mu) \longrightarrow \mathbb{R}\}_{t \in [0,1]}$ indexed by the closed unit interval in $\mathbb{R}$ satisfying the following conditions:*

- *For each $t \in [0,1]$, we have $E(W_t^\circ) = 0$.*

- *For any $t_1, t_2 \in [0,1]$, we have $\mathrm{Cov}(W_{t_1}^0, W_{t_2}^\circ) = \min\{t_1, t_2\} - t_1 t_2$.*
